### Minimum feed-in tariff 2023-24

### **Submission received through Engage Victoria**

**Date submitted: 20/12/2022** 

Submission written by: Daryl Hodson

From December 2022, we began accepting submissions on our Minimum feed-in tariff review 2023-24 via Engage Victoria (<a href="www.engage.vic.gov.au">www.engage.vic.gov.au</a>). On this website, people were given the opportunity to send us a response to a set of questions we provided.

# What parts of our proposed methodology for setting the minimum single and time-varying feed-in tariff rates do you consider are appropriate?

I fail to see how you are proposing a drop in the FIT when energy prices are rising

### What parts of our proposed methodology should we change?

Home owners financial investment

## For our overall methodology, or parts of it, what alternative methodologies should we consider?

The FIT helps offset the daily supply charge. It seems that you are slowly moving towards reducing the FIT to zero. At 4.8 cents it is meaningless to most households. I believe your agenda is not to support household solar and a transition to renewable energy, but to support the big generators and their profits. At 4.8 cents our electricity generated by us with infrastructure paid for by us, is onsold by retailers at a massive markup. The FIT should remain at 6 cents or more and should be linked to inflation. Household solar has done most of the heavy lifting in producing renewable electricity yet we are treated with complete disdain.
