A fair price for solar

9/2/16

There is no price incentive for me to sell my excess solar power to the grid if I can get around it by storing power in batteries and using it at night time for my household use or charging an electric vehicle. As soon as the price of batteries drops a little, that is exactly what I will be doing.

If energy companies want to harvest excess solar power for resale, they need to offer a real incentive or watch most of their customers gradually withdraw , either mostly or completely, from the grid.

If the government, energy companies and community wants customers to stay on the grid, the price of solar exported from households needs to be much higher. it's as simple as that.
