### **Solar feed in tariff**

9/2/16

I note that you are taking submissions.

As the owner of a domestic solar rooftop system I feel that people in my position should have some input.

Key points:

- Feed-in tariff is unreasonably low given what my power delivery can be sold on as
- If you keep FIT it too low you will only encourage domestic suppliers to simply move to batteries - is this what you want?
- Long term we need to minimise our carbon footprint

In summary - please take a long-term view, not the short term expediency seemingly approach taken by others

Thank you
