Dear sir/madam

I recently attended the Regulatory review on the 13th May and noted many of the concerns from the consumer groups which I believe could be addressed by the implementation of low cost IHD's in conjunction with smart meters.

The benefits could include - identification of current suppliers and contact numbers, flags for billing overcharging, assistance for consumers to understand energy usage , energy outage notification and several more .

I also believe a central laboratory where manufacturers of IHD devices could access the various smart meter suppliers to enable pairing of the various IHD devices would be of considerable benefit . Consumers wanting to extract zigbee data from these meters currently have few options.

regards

Wayne
