Essential Services Commission (ESC) – Public Forum on energy distribution payments from solar

27/5/16

Thanks for including the public to have their say last night in Geelong.

There still seems to be a consensus that rooftop feed in is grossly undervalued and that it should reflect more than just the bare wholesale price.

Also, that it needs to be more incentivised to reflect the environmental benefits of it assisting in times of peak demand. Through smart metering capabilities, customers should have the ability to sell power at times when they can capitalise on a premium value. In turn this incentive will also provide much needed relief during critical demand periods and a significantly decreased burden on the grid.
