**Energy enquiry**

9/2/16

I am writing as a citizen that wants to use solar power but can't afford to.

Why can electricity companies buy electricity from me for 5 cents a Kw and then on sell it for 30-35cents a Kw?

Buy feeding electricity back into the grid, solar users reduce the strain on the network and the need to power up more coal powered stations during times of peak usage.

It's time to consider a more worthwhile feed in tariff for those who rely on that tariff to pay off their investment in solar and the future of our environment.
