Solar feed in Tariff

10/2/16

I believe the solar feed in tariff should be priced fairly. It doesn't matter what that price is as long it is fair. A minimum solar feed in tariff of five cents is demonstrably not fair.

If the supply of electricity to our society is supposed to be a market, it should act like a market. But currently it isn't a real market, just a series of near monopolies controlled by interest groups.

The threat of climate change demands innovative solutions to the way we use and supply energy. Having a real market price for energy, no matter its source, will help drive the needed changes.

Having distributed sources will also help protect our society against the threats of catastrophic failure to centralised systems.
